

# Bench Buffer

In order to automate your research facility, various systems can be integrated.

WPS provides a wide range of systems for process automation. Our expertise includes the automation of greenhouses for production purposes, as well as for research and development facilities, such as those used by breeders, universities and crop protection product developers.

Manually storing or adding benches to a fully automated system? If it is up to WPS, this too will be automated. WPS has developed a bench buffer for a crop protection product development facility. When an experiment is initiated, the appropriate number of benches are automatically transported to the input position.

Once an experiment is finished, the benches return automatically to the bench buffer. The stacking of benches not only streamlines the process but also saves valuable space for other process steps.
