

Bench Washer

In order to automate your research facility, various systems can be integrated.

WPS provides a wide range of systems for process automation. Our expertise includes the automation of greenhouses for production purposes, as well as for research and development facilities, such as those used by breeders, universities and crop protection product developers.

Benches are widely used for plant cultivation. Consequently, WPS possesses expertise in developing bench systems for plant research. To automate the entire process, it is essential to address the cleaning of these benches. In response, WPS has engineered a bench washer that autonomously tilts, cleans, and dries the containers.
